How to Run the Extension

Step 1: Install the `.vsix` File

After packaging the extension, you can install it using one of two methods:

- **Via VS Code Interface:**
  1. Open VS Code and navigate to the **Extensions** tab (`Ctrl+Shift+X` or `Cmd+Shift+X`).
  2. Click the **three dots (...)** in the top right corner of the extensions panel.
  3. Select **Install from VSIX...** and choose your file.
- Via terminal

```
code --install-extension bias-detector-0.0.1.vsix
```

Step 2: System Prerequisites

The extension relies on a Python engine running in the background. Make sure you have Python 3 installed.

> **Linux Users (Ubuntu/Debian):** The interpreter requires the system's virtual environment module. Install it by running the following command in your computer's terminal:
>
> ```
> sudo apt update && sudo apt install python3-venv
> ```

Step 3: Running the Analysis

1. Open your project folder in VS Code.
2. Open the code file you want to analyze (e.g., `battle.py`).
3. Open the **Command Palette** (`Ctrl+Shift+P` or `Cmd+Shift+P`).
4. Type and select: `Bias Detector: Analyze File` (or your configured command).
5. Enter your Gemini API key when prompted.

The final report containing the results will be automatically generated in the `reports/final_result.json` folder.
